The part of my assigned task that I found the most challenging was the part with implementing the keyboard controls to change the color of the triangle and set its position to default values. I knew how to move the triangle on the screen using A, D, W, and S keys because the task was similar to the previous ones. However, I did not know how to modify the color and use the C and R keys to trigger an action. Using ChatGPT, I learned what conditions and functions I had to use for the C and R keys to work correctly. Using the AI, I managed to understand how to use the keyboard callback function to call glutPostRedisplay() function to update the display. Overall, I learned a lot about keyboard control in OpenGL in this part of the assignment.
